Topological distances: Network Portrait Divergence (PD)

Again, 3 conditions (table 1)

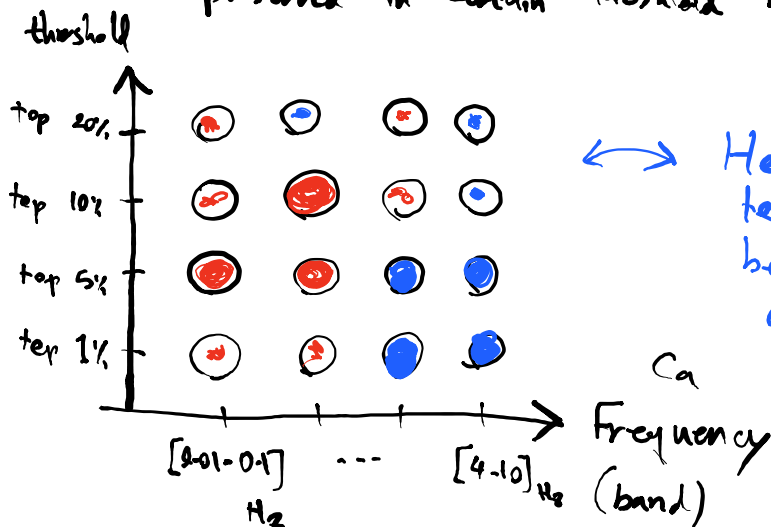

Actually: show portraits for  $\alpha$  and BOLD

$\Rightarrow$  Network topologies are not significantly different across modalities (or are they?)

Do they coincide at similar threshold values?  
Is there any meaningful structure that is preserved in certain threshold range?

$\leftrightarrow$  Heat map of topological similarity between interaction graphs as estimated using BOLD or  $\alpha$
